PHYTOCHEMICAL STUDIES ON *PLATYCodon GRANDIFLORUM* (JACQ.) A. INTRODUCED IN BULGARIA

Nguyen THUAN* – Stefan NIKOLOV*

SUMMARY

*Platycodon grandiflorum* (Fam. *Campanulaceae*) is widely used as an expectorant and antiinflammatory drug in the traditional and folk medicine of the East-Asian subcontinent of which it is native, whereas it is not well known in Europe. It has now been introduced in Bulgaria, and therefore, became the object of our phytochemical investigations mainly for the saponins and flavonoids. All the investigated parts of the plant (roots, stems and leaves) contain saponins with HI >1000. By the TLC methods 5 pentacyclic triterpenoid saponins were established in the roots. In the herb of the plant, 8 flavonoids and 4 phenolic acids were established by PC. By CC method and preparative PC, 3 flavonoids and one phenolic acid have been isolated in pure state. They are - luteolin -7-O-D - glycoside (*Cinerarin*), apigenin -7-O-D-glucoside, luteolin and chlorogenic acid. They were identified by the determination of their m.p.s, UV spectra, acid hydrolysis and PC comparison with authentic samples in different solvent systems. The last three compounds have identified for the first time from the species.

KEY WORDS

*Platycodon grandiflorum*, saponins, flavonoids, flavones, flavone glycosides

INTRODUCTION

*Platycodon grandiflorum* (Jacq.) A. DC is well known more as a decorative than a medicinal plant in Europe. The species has widespread application in traditional and folk medicine of the oriental countries, where it has its native habitat. The roots contain saponins and has expressed expectorant activity similar to *Radix Primulae*. Further, sedative, analgetic, antipyretic, anti-ulcerative and tonic effects /1/ have been elucidated. The object of our investigation is to find out the chemical constituents, mainly saponins and flavonoids of *Platycodon grandiflorum* which has been introduced in Bulgaria. No information of its flavonoidal constituents in the herb was available in our survey of literature. In this work we describe the results of the quantitative and TLC studies on the roots of the species for the presence of saponins and sapogenins, and investigation of the herb for flavonoids.

MATERIAL AND METHODS

The plant material was obtained from the introduced samples, cultivated during 1993 in the Institute of Botany, Bulgarian Academy of Sciences, Sofia. A voucher sample has been deposited in the herbarium of the Botanical Institute, Sofia (SOM), Co-298. TLC investigations were carried out on Kieselgel G Merck plates in systems: Chloroform - Methanol - Water (60:36:2) [S1], Benzene - Chloroform - Methanol (3:3:1) [S2], Benzene - Ethyl acetate (6:3) [S3]. PC was conducted on the paper Filtrak FN1, and the preparative PC was conducted on Filtrak FN7 in the systems n-Butanol - Acetic acid - Water (4:1:2.2) [S4], 15% Acetic acid [S5] and 60% Acetic acid [S6]. The saponins and sapogenins were detected by p-Dimethylaminobenzaldehyde [R1] /2/, after warming the chromatograms at 110° C for 7-8 minutes, and the flavonoids by 3% ethanolic Aluminium hydrochloride solution [R2]. The acid hydrolysis of the saponins was conducted using 5% H₂SO₄ for 8 hours, and for the

flavonoids with 5% HCl for 2 hours.

I. STUDIES ON THE CONTENTS O

Froth Index (F1) and Haemol leaves by established methods. 150 g extracted 6 times each, with meth extracts were combined and concentrated. This aqueous solution was treated with The object of our further work became 3.87 g. The saponin contents in the the systems S₁ and S₂ and developm sapogenins were extracted twice wit development with R₁.

II. STUDIES ON THE CONTENTS

220 g herb was extracted five the combined ethanolic extracts v treated with chloroform and ethyl aceton presence of flavonoids and was further PC in the systems S₄ and S₅ by development with over 40 g polyamide by elution with 200 fractions. each of 100 ml. in rechromatography over column, sepa
flavonoids with 5% HCl for 2 hours. UV spectroscopy was carried out on the apparatus SPECORD UV-VIS in methanol and standard diagnostic shift reagents.

EXPERIMENTAL

I. STUDIES ON THE CONTENTS OF SAPONINS AND SAPOGENINS

Froth Index (F1) and Haemolytic Index (HI) were determined for the roots, stems and leaves by established methods. 150 g of the studied plant material, after size reduction were extracted 6 times each, with methanol for 1 hour each. After filtration, the methanolic extracts were combined and concentrated to a thick mass which was dissolved in hot water. This aqueous solution was treated with chloroform, ethyl acetate and n-butanol consecutively. The object of our further work became the butanolic extract which was obtained in the yield of 3.87 g. The saponin contents in the butanolic extract was studied by two-dimensional TLC in the systems S1 and S2 and development by R1. After acid hydrolysis of the butanolic extract, the saponins were extracted twice with ether and characterised by TLC in the system S3 by development with R1.

II. STUDIES ON THE CONTENTS OF FLAVONOIDS

220 g herb was extracted five times with 80% ethanol for 1 hour each. After filtration the combined ethanolic extracts were concentrated and the obtained aqueous extract was treated with chloroform and ethyl acetate consecutively. The ethyl acetate extract showed the presence of flavonoids and was further studied for the flavonoidal contents by two-dimensional PC in the systems S4 and S5 by development with R2. 70 g dry extract was separated by CC over 40 g polyamide by elution with increasing concentration of ethanol up to 90% ethanol. 200 fractions, each of 100 ml, were collected. From the combined fractions, after rechromatography over column, separation by preparative PC in the systems S4, S5 & S6 and
recrystallization from methanol, 3 flavonoidal compounds and one phenolic acid were obtained in pure state.

Flavonoid F₁ (Luteolin-7-O-glucoside). M.P. 207-210°C (MeOH), Rf = 0.42 in S₄ and 0.12 in S₅. λ max (MeOH) nm 255, 268 sh, 350; (+NaOAc) 265, 300 sh, 400; (+NaOAc) 269, 266 sh, 370 sh, 400; (+NaOAc +H₂BO₃) 260, 375; (+AlCl₃) 275, 300 sh, 330, 430; (AlCl₃+ HCl) 270, 300 sh, 358, 390.

Flavonoid F₂ (Apigenin-7-O-glucoside). M.P. 207-210°C (MeOH), Rf = 0.39 in S₄ and 0.28 in S₅. λ max (MeOH) nm 268, 335; (+NaOMe) 245, 268, 300 sh, 385, 390; (+NaOAc) 269, 355, 385, 395; (+NaOAc +H₂BO₃) 269, 340; (+AlCl₃) 276, 300, 350, 390; (+AlCl₃+HCl) 278, 300, 341, 380.

Flavonoid F₃ (Luteolin) M.P. 293-295°C (MeOH), Rf = 0.84 in S₄ and 0.67 in S₆. λ max (MeOH) nm 256, 351; (+NaOMe) 268, 405; (+NaOAc) 372, 403; (+NaOAc +H₂BO₃) 269, 371; (+AlCl₃) 273, 422; (+AlCl₃+HCl) 275, 357, 380.

Compound F₄ (Chlorogenic acid) Rf = 0.70 in S₄, 0.72 in S₅ and 0.84 in S₆. λ max (MeOH) nm 305, 325.

**RESULTS AND DISCUSSION**

The phytochemical investigations carried out were targeted towards establishment and characterisation of the saponins and flavonoids in the species *Platycodon grandiflorum* introduced in Bulgaria. It is well known that the expectorant, anti-inflammatory, anti-ulcerative and tonic properties are due to these two groups of the biologically active compounds. Besides, the saponin and the flavonoidal contents can be expressed by qualitative and quantitative characters for the standardisation of the crude drugs, extracts, and the phytopreparations which could be obtained from this species.

The results of the determination of the FI<100 and HI>1000 show that saponins with high haemolytic index is present in all the organs of the species. By two-dimensional TLC of the purified extracts, it was found that 1 compound. After acid hydrolysis of Δ₁₂ - oleanan type were characterised which prove that from this species platycogenic acid which have been obtained. A flavonoidal presence of at least 8 flavonoids separation, 3 flavonoidal compounds having their melting points, PC comparison of spectral analysis in methanol and other solvents - luteolin-7-O-glucoside, apigenin.

purified extracts, it was found that the roots of the plant contain at least 5 pentacyclic triterpenoid compounds. After acid hydrolysis of the purified saponin mixture, 2 sapogenins of the group Δ^12 - oleanan type were characterised by TLC. These data are confirmed by the literature, which prove that from this species contain sapogenins of the oleanan type platyccogens and platycenic acid which have been characterised structurally /3, 4/. From the herbal part of the plant was obtained a flavonoidal mixture, which by two-dimensional PC studies exhibited the presence of at least 8 flavonoids and 4 polyphenolic acids. By CC and preparative PC separation, 3 flavonoidal compounds and 1 phenolic acid were isolated. By determination of their melting points, PC comparison with authentic samples in different systems and UV - spectral analysis in methanol and other diagnostic shift reagents these compounds were identified as - luteolin-7-O-glucoside, apigenin-7-O-glucoside, luteolin and chlorogenic acid. Further phytochemical investigations on the species Platycodon grandiflorum, introduced in Bulgaria are in continuation.
